
How the Station Works

- ⇒ Natural Gas is delivered to Rockport through a pipeline. At this point, the odorant methyl mercaptan is added to the natural gas to facilitate leak detection throughout the system. This is the same gas that is delivered to homes and businesses throughout the area.
- ⇒ A newly constructed pipeline along Colorado Street delivers natural gas to the storage tanks located in ACISD's fleet yard.
- ⇒ The natural gas is pressurized by the compressor to make its volume smaller.
- ⇒ The fuel pump dispenses the compressed fuel to the vehicle at roughly the same rate as a traditional gasoline or diesel pump.
